### BARBARA A. DEBUONO, M.D., M.P.H. Commissioner

Expires 12:01 AM April : 1, 1999 ISSUED April 1, 1998 REVISED July 28, 1998

# CERTIFICATE OF APPROVAL FOR LABORATORY SERVICE

Issued in accordance with and pursuant to section 502 Public Health Law of New York State

Lab ID No.: 11109

Director: DR. YUN-SHEN LEE

Lab Name: ACCREDITED LABORATORIES INC

Address: 20 PERSHING AVENUE CARTERET NJ 07008

is hereby APPROVED as an Environmental Laboratory for the category

ENVIRONMENTAL ANALYSES/SOLID AND HAZARDOUS WASTE

All approved subcategories and/or analytes are listed below:

haracteristic Testing :
Corrosivity
gnitability
eactivity
TCLP
E.P. Toxicity

Miscellaneous :
 Cyanide, Total
 Lead in Paint
 Hydrogen Ion (pE)
 Sulfide (as S)
Priority Polintant Phenois (ALL)

Acrolein and Acrylonitrile (ALL) Chlorinated Eydrocartons (ALL) Metals I (ALL) Kitroaromatics Isophorone (ALL) Polychlorinated Siphenyls (ALL) Purgeable Aromatics (ALL) Chlor. Eydrocarbon Pesticides (ALL)
Ealoethers (ALL)
Hetals II (ALL)
Polynuclear Arom. Hydrocarbon (ALL)
Fathalate Esters (ALL)
Furgeable Halocarbons (ALL)

Serial No.: 103528

Wadsworth Center

Property of the New York State Department of Health. Valid only at the address shown.

Must be conspicuously posted. Valid certificate has a red serial number.

DOH-3317 (3/97)

Percent solid of 100 is used for all target compounds.

- J Indicates compound concentration found below MDL.
- D Indicates result is based on a dilution.
- I Result exceeds industrial surface soil standards.*
- 8 Indicates compound found in associated blank.
- J Indicates compound concentration found below MOL.
  B Indicates compound found in associated blank.
  B Indicates compound analyzed for but not detected.
  E Indicates result exceeds highest calibration standard
  - R Result exceeds residential surface soil standards.*

^{*} Flags are based on New Jersey Soil Eleanup Eriteria from Site Remediation News Volume 06 Number 1.

#### 1.0 INTRODUCTION

MACTEC Engineering and Consulting, P.C. (MACTEC) was tasked by the New York State Department of Environmental Conservation (NYSDEC) to conduct a Vapor Intrusion (VI) Investigation for the New Cassel Industrial Area (NCIA) site (Site) (Site # 130043) in Nassau County, New York (Figure 1.1). The VI Investigation was conducted in accordance with Work Assignment (WA) No. D004434-31 (NYSDEC, 2009) and the Field Activities Plan (FAP) (MACTEC, 2010) to assess the potential for contamination at seven spill sites within the NCIA to result in exposure to volatile organic compounds (VOCs) from soil vapor migration.

#### 1.1 PROJECT BACKGROUND

WA D004434-31 included seven discrete properties within the NCIA:

- IMC Magnetics, 570 Main Street, New Cassel, NYSDEC Site No. 130043A;
- Atlas Graphics, 567 Main Street, New Cassel, NYSDEC Site No. 130043B;
- Tishcon Corp. (125 State Street), New Cassel, NYSDEC Site No. 130043C;
- Former Tishcon Corp., 68 Kinkel Street, Westbury, NYSDEC Site No. 130043F;
- Former Laka Industries, Inc., 62 Kinkel Street, Westbury, NYSDEC Site No. 130043K;
- EZ-EM, Inc., 750 Summa Avenue, North Hempstead, NYSDEC Site No. 130043N; and
- Tishcon Corp. (New York Ave), 29 New York Avenue, North Hempstead, NYSDEC Site No. 130043V.

#### 1.2 PURPOSE OF INVESTIGATION AND REPORT

Past activities associated with each of the sites within the NCIA have contributed to groundwater contamination. A soil vapor study around the perimeter of these properties in 2008 identified the potential for vapor migration into the buildings (Camp Dresser and McKee [CDM], 2008). This VI Investigation inside Site buildings was conducted to assess the potential for vapor migration.

The VI field work was performed in accordance with the FAP (MACTEC, 2010), Health and Safety Plan (MACTEC, 2005), and Quality Assurance Program Plan (QAPP) (MACTEC, 2007).

#### 1.3 REPORT ORGANIZATION

This Vapor Intrusion Investigation Report (Report) was prepared to summarize the field activities and corresponding soil vapor, indoor air, ambient air, and soil sampling results. A summary of field sampling activities completed in February and May 2010 as well as February 2011 is provided in Section 2. Findings from field sampling activities are presented in Section 3. Conclusions from the field sampling activities are presented in Section 4.

The following are provided as appendices:

- · Appendix A: Field Data Records
- · Appendix B: Structure Inspection/Inventory and Questionnaire
- · Appendix C: Photographic Logs
- · Appendix D: Direct Push Soil Boring Logs
- · Appendix E: Data Usability Summary Reports (DUSRs) and Analytical Data

#### 2.0 FIELD ACTIVITIES

Field activities summarized in this Report include one round of VI sampling during the 2010 and 2011 heating seasons. VI sampling activities were performed in February 2010 and February 2011 to evaluate the potential for vapor migration at seven properties within the NCIA. A direct push soil sampling program was also performed in May 2010 at the Tishcon Corp. New York Avenue Site (NYSDEC Site No. 130043V) to evaluate the presence/absence of a potential source area(s) in shallow soil adjacent to the building.

A summary of the property addresses and their corresponding structure identification number is provided in Table 2.1. Locations of the seven sites are shown on Figure 2.1.

#### 2.1 VI SAMPLING

VI sampling was conducted during the 2010 and 2011 heating seasons at seven structures within the NCIA. VI samples were collected over a 24-hour duration from each of the seven structures. Structures sampled in 2010 included VI samples from three (3) sub-slab locations and two (2) indoor air locations for VOC analysis, per New York State Department of Health (NYSDOH) guidance. When possible, an outdoor ambient air sample was collected in conjunction with the indoor air sample. In February of 2011, . three (3) sub-slab and three (3) indoor air samples were collected for VOC analysis at the Tishcon Corp. 125 State Street Site (NYSDEC Site No. 130043C).

A total of 21 sub-slab vapor samples, 15 indoor air samples, four (4) exterior ambient air samples and two duplicate samples were collected. VI samples were analyzed for VOCs using United States Environmental Protection Agency (USEPA) Method TO-15 (soil vapor/air) by Centek Laboratory from Syracuse, New York, a NYSDEC Environmental Laboratory Approval Program certified laboratory. Field data records were completed during the investigation and are provided in Appendix A.

#### 2.1.1 Structure Inspection/Inventory and Questionnaire

Prior to sample collection, MACTEC completed the NYSDOH "Indoor Air Quality Questionnaire and Building Inventory" form for each structure, screened ambient indoor air for total VOCs using a parts per billion miniRAE, and selected sample locations. Copies of the completed questionnaires are provided in Appendix B.

#### 2.1.2 Sub-Slab Vapor Sampling

Sub-slab vapor samples were collected from below the building's concrete slab in 1-liter SUMMA®-type canisters regulated with a 24-hour flow valve. The procedure detailed in the FAP (MACTEC, 2010) was followed for sub-slab vapor point installations.

Photographic logs documenting field activities conducted during the SVI at the seven structures are provided in Appendix C.

Approximately 24 hours after sample collection, the flow valves were shut off. The time and remaining vacuum in the canister were noted on the field data record (Appendix A). Upon completion of the sampling, the tubing and stopper were removed from the building floor and the holes were filled with a fast drying concrete.

#### 2.1.3 Air Sampling

Indoor air samples were collected in 1-liter SUMMA®-type canisters in the vicinity of the sub-slab vapor sample collection points. MACTEC collected the indoor air sample away from sumps. Indoor air samples were collected from approximately four to six feet above the floor level. Indoor air samples were set up with 24-hour flow valves. Approximately 24 hours after sample collection, the flow valves were shut off. The time and remaining vacuum in the canister were noted on the field data record (Appendix A).

Ambient air samples were collected in 1-liter SUMMA®-type canisters from the vicinity of four structures being sampled for indoor air and sub-slab vapor VOC contamination. Samples were collected from approximately three to six feet above ground surface. Ambient air samples were set up

with 24-hour flow valves. Approximately 24 hours after sample collection, the flow valves were shut off. The time and remaining vacuum in the canister were noted on the field data record (Appendix A).

Field quality control samples included duplicate sample collection. Two field duplicate samples were collected (Structure C and Structure V) at sub-slab vapor points using an in-line tee fitting to split the sub-slab vapor sample between two canisters.

#### 2.2 DIRECT PUSH SOIL SAMPLING – MAY 2010

Results obtained during the 2008 soil gas sampling program at the Tishcon Corp. New York Ave. Site (NYSDEC Site No. 130043V) (CDM, 2008) suggested a potential source area in soil adjacent to the southern portion of the Site. To fill this data gap, direct push soil sampling was conducted at the site: five (5) soil borings were advanced (DP-1 through DP-5). Soil borings were advanced using direct push technology as described in the Section 4.5.1.1 of the QAPP (MACTEC, 2007). Soil samples were collected from a five-foot long, 2 inch diameter core sampler with an acrylic liner. Soil samples were collected continuously from the ground surface to 25 feet below ground surface (bgs), or until refusal. Photoionization detector (PID) headspace readings was used to screen soil samples for the presence of total VOCs as each soil sample was removed from the sample collection tube. Samples were described using the Unified Soil Classification System. The sample description and classification, VOC headspace reading, and boring observations were recorded on the field data record as described in Subsection 4.5.2 of the QAPP (Appendix D). Refusal was encountered at location DP-3 at approximately 1 foot bgs; therefore soils samples were not collected from this location.

Based on the PID screening readings, the sample exhibiting the highest screening measurement from each of the soil borings (a total of four samples) was submitted to Chemtech Laboratories of Mountainside, New Jersey for VOCs by USEPA Method 8260B. Appendix D provides the direct push soil boring logs and relevant site photos.

#### 3.0 VAPOR INTRUSION INVESTIGATION FINDINGS

Laboratory results were reviewed and evaluated in accordance with the "Guidance for the Development of Data Usability Reports" (NYSDEC, 2002). Validated results and the Data Usability Summary Report are included as Appendix E. Tables 3.1 through 3.9 provide a summary of compounds detected and applicable New York State standards and/or guidance criteria.

The field data records and Structure Inspection/Inventory and Questionnaire for the NCIA sites are provided in Appendices A and B.

#### 3.1 IMC MAGNETICS (SITE 130043A) FINDINGS

The IMC Magnetics site is located at 570 Main St., New Cassel, New York in the western part of the NCIA. The site was listed as a Class 2 site in 1995. From October 1997 to 2004, IMC Magnetics Inc. operated a soil vapor extraction (SVE) system to remediate on-site soil contamination at the northwest corner of the Site. The Record of Decision (ROD) for operable unit (OU)-1, On-Site Soil Contamination, incorporating the SVE system, was issued in January of 1998. The ROD for OU-2 On-Site Groundwater was issued in March 2000. The remedy selected for groundwater remediation at this site was in-situ oxidation using hydrogen peroxide injection; treatment began in December 2001. It is unknown if groundwater treatment is currently taking place. A soil vapor and groundwater investigation which consisted of five direct push borings drilled around the perimeter of the facility was conducted by CDM in 2008. Results from the investigation revealed high concentrations of VOCs in the soil vapor in excess of NYDOH guidelines, and concentrations of tetrachloroethene (PCE) and trichloroethene (TCE) in excess of New York State standards for Class GA groundwater. The investigation suggested a potential source area in the northwest corner of the site and concluded that further investigation was required to evaluate potential exposures associated with vapor intrusion (CDM, 2008)

VOCs detected in sub-slab vapor and indoor air samples collected from the IMC Magnetics site (Structure A) during the 2010 VI Investigation are shown in Table 3.1. Indoor air and sub-slab soil vapor locations are presented on Figure 3.1.

Chlorinated VOC results with associated NYSDOH guidance criteria, that were detected in the subslab soil vapor from Structure A (A-SS-01, A-SS-02 and A-SS-03) are:

- PCE concentrations ranged from 4,600 micrograms per cubic meter (μg/m³) to 400,000 μg/m³;
- cis-1,2-dichloroethene (DCE) concentrations ranged from non-detect to 2,800 EJ μg/m³;
- 1,1,1-trichloroethane (TCA) concentrations ranged from 2.8 μg/m³ to 240 μg/m³;
- TCE concentrations ranged from  $19 \mu g/m^3$  to  $4,400 J \mu g/m^3$ , and,
- carbon tetrachloride, 1,1-DCE and vinyl chloride were not detected above the reporting limit.

Chlorinated VOC results with associated NYSDOH guidance criteria, that were detected in the indoor air from Structure A (A-IA-01 and A-IA-02) are:

- PCE concentrations ranged from 74 J μg/m³ to 220 μg/m³;
- cis-1,2-DCE concentrations ranged from non-detect to 1.6 μg/m³;
- TCE concentrations ranged from 1.6 J μg/m³ to 5.6 J μg/m³,
- carbon tetrachloride concentrations ranged from 0.45 J μg/m³ to 0.51 J μg/m³; and,
- 1,1,1-TCA, vinyl chloride and 1,1-DCE were not detected above the reporting limit.

#### 3.2 ATLAS GRAPHICS (SITE 130043B) FINDINGS

The Atlas Graphics site (Structure B) is located at 567 Main Street, Westbury, New York in the western part of the NCIA. The building was built in 1950, and used as a warehouse for construction vehicles until 1997. In 1997, the property was purchased by Atlas Graphics Inc., which currently operates a photo-engraving manufacturing operation. This operation uses a reported 312 gallons per year of TCE. At the time of its purchase, the building was connected to a cesspool for sanitary waste disposal. In 1977, there was a documented discharge of approximately 50 gallons of TCE to the cesspool. Analytical results detected elevated concentrations of TCE in the soil and groundwater above New York State standards. The ROD for this site was issued in February 2000, and selected an air sparging (AS) and SVE system as the remedy to address the on-site contaminated soil and groundwater. The AS/SVE system was constructed in October 2000 and was operated through November 2003. A soil vapor and groundwater investigation which consisted of five direct push borings drilled around the perimeter of the facility was conducted by CDM in 2008. Results from the investigation revealed concentrations of solvent VOCs in the soil vapor in excess of NYSDOH

guidelines and concentrations of PCE, TCE, and 1, 1, 1-TCA in excess of New York State standards for Class GA groundwater. The investigation suggested a potential source area at the site and concluded that further investigation was required to evaluate potential exposures associated with vapor intrusion (CDM, 2008).

VOCs detected in sub-slab vapor and indoor air samples for the Atlas Graphics site (Structure B) during the 2010 VI Investigation are shown in Table 3.2. Indoor air and sub-slab soil vapor locations are presented on Figure 3.2.

Chlorinated VOC results with associated NYSDOH guidance criteria, that were detected in the subslab soil vapor from Structure B (B-SS-01, B-SS-02 and B-SS-03) are:

- PCE concentrations ranged from 1,400 μg/m³ to 4,200 μg/m³;
- cis-1,2-DCE concentrations ranged from 8.5 μg/m³ to 26 μg/m³;
- 1,1,1-TCA concentrations ranged from 160 EJ μg/m³ to 240 μg/m³;
- TCE concentrations ranged from 4,100 μg/m³ to 31,000 μg/m³,
- 1,1-DCE concentrations ranged from non-detect to 2.5 µg/m³; and
- carbon tetrachloride and vinyl chloride were not detected above the reporting limit.

Chlorinated VOC results with associated NYSDOH guidance criteria, that were detected in indoor air from Structure B (B-IA-01 and B-IA-02) are:

- PCE concentrations ranged from 1.6 J  $\mu$ g/m³ to 1.9 J  $\mu$ g/m³;
- TCE concentrations ranged from  $27 \mu g/m^3$  to  $28 \mu g/m^3$ ; and
- cis-1,2-DCE, 1,1,1-TCA, 1,1-DCE, carbon tetrachloride and vinyl chloride were not detected above the reporting limit.

#### 3.3 TISHCON CORP (125 STATE STREET) (SITE 130043C) FINDINGS

The Tishcon Corp site (Structure C) located at 125 State Street, New Cassel, New York is within the central part of the NCIA. Tishcon produced dietary supplements and vitamin products in the form of powders and tablets. The powders and tablets were produced in a dry blending process. From 1985 to 1993, the chemicals methylene chloride, 1,1,1-TCA, and methanol were used in the tablet coating process. Equipment used in the process was rinsed in the driveway where storm drains were located. Based on the presence of VOCs and metals in four storm drains at the site, the Nassau County

Department of Health requested that contaminated sediment be removed from the storm drains and a distribution box on the property. The excavation and restoration of the contaminated source areas, including two storm drains and a distribution box was completed as an Interim Remedial Measure (IRM) in October 1997. The ROD for the site was issued in January 1998 and required the excavation and restoration of the remaining source area. Excavation and disposal of this material was completed in the spring of 1999. In March 2000, the site was reclassified as a Class 4 site indicating the site was properly closed and monitoring is required. It is uncertain whether a monitoring program is currently being implemented at the Site. A soil vapor and groundwater investigation which consisted of five direct push borings drilled around the perimeter of the facility was conducted by CDM in 2008. Results from the investigation detected concentrations of solvent VOCs in the soil vapor in excess of NYSDOH guidelines. VOCs were detected in groundwater including PCE, TCE, and 1,1,1-TCA but concentrations did not exceed New York State standards for Class GA groundwater. It was concluded that further investigation was required to evaluate potential exposures associated with vapor intrusion at the site (CDM, 2008).

VOCs detected in sub-slab vapor, indoor air and ambient air samples for the Tishcon Corp. site (Structure C) during the 2011 VI Investigation are presented in Table 3.3. Indoor air and sub-slab soil vapor locations are presented on Figure 3.3.

Chlorinated VOC results with associated NYSDOH guidance criteria, that were detected in the sub-slab soil vapor at Structure C (C-SS-01, C-SS-01Duplicate, C-SS-02 and C-SS-03) are:

- PCE concentrations ranged from 860 μg/m³ to 9,800J μg/m³;
- cis-1,2-DCE concentrations ranged from non-detect to  $0.48 J \mu g/m^3$ ;
- 1,1,1-TCA concentrations ranged from 440 μg/m³ to 3,300J μg/m³;
- TCE concentrations ranged from 3.3 μg/m³ to 20 μg/m³;
- 1,1-DCE concentrations ranged from  $0.6 \mu g/m^3$  to  $2.4 \mu g/m^3$ ; and
- carbon tetrachloride and vinyl chloride were not detected above the reporting limit.

Chlorinated VOC results with associated NYSDOH guidance criteria, that were detected in indoor air at Structure C (C-IA-01, C-IA-02 and C-IA-03) are:

- PCE concentrations were detected at 2.0 μg/m³;
- TCE concentrations ranged from 0.27  $\mu g/m^3$  to 0.55  $\mu g/m^3$ ;
- 1,1,1-TCA concentrations ranged from 1.0J  $\mu$ g/m³ to 1.0  $\mu$ g/m³;

- carbon tetrachloride concentrations ranged from  $0.51 \,\mu\text{g/m}^3$  to  $1.0 \,\mu\text{g/m}^3$ ; and,
- cis-1,2-DCE, 1,1-DCE, and vinyl chloride were not detected above the reporting limit.

# 3.4 FORMER TISHCON CORP., 68 KINKEL STREET (SITE 130043F) FINDINGS

The Former Tishcon Corporation site located at 68 Kinkel Street, Westbury, NY is located within the central part of the NCIA. The one quarter acre site is occupied by a single story, 2-bay garage. In 1982 and 1983, Tishcon utilized 1650 gallons of 1,1,1-TCA, 8000 gallons of methylene chloride, and 3000 gallons of shellac in its manufacturing process. A superfund investigation was completed in July 1996 and a ROD was issued in January 1997, requiring no action for this site. A soil vapor and groundwater investigation which consisted of five direct push borings drilled at the north, northeast, and northwest perimeter of the facility was conducted by CDM in 2008. Results from the investigation revealed elevated concentrations of VOCs in the soil vapor that exceeded NYSDOH guidelines. VOCs were detected in groundwater including concentrations of PCE, TCE, Methyl Tertiary Butyl Ether (MTBE) and cis-1,2-DCE in excess of New York State standards for Class GA groundwater. The investigation suggested a potential source area at the site and concluded that further investigation was required to evaluate potential exposures associated with vapor intrusion (CDM, 2008).

VOCs detected in sub-slab vapor and indoor air samples for the Former Tishcon Corp site (Structure F) during the 2010 VI Investigation are shown in Table 3.4. Indoor air and sub-slab soil vapor locations are presented in Figure 3.4.

Chlorinated VOC results with associated NYSDOH guidance criteria that were detected in the subslab soil vapor from Structure F (F-SS-01, F-SS-02 and F-SS-03) are:

- PCE concentrations ranged from 110 J μg/m³ to 290 μg/m³;
- 1,1,1-TCA concentrations ranged from 9.9  $\mu g/m^3$  to 110  $\mu g/m^3$ ; and
- TCE concentrations ranged from 0.6 J  $\mu$ g/m³ to 4.2  $\mu$ g/m³.
- carbon tetrachloride, cis-1,2-DCE, 1,1-DCE and vinyl chloride were not detected above the reporting limit.

Chlorinated VOC results with associated NYSDOH guidance criteria that were detected in indoor air from Structure F F-IA-01 and F-IA-02) are:

• PCE concentrations ranged from 1.7 J μg/m³ to 1.9 J μg/m³;

carbon tetrachloride concentrations ranged from 0.45 J µg/m³ to 0.51 J µg/m³

- TCE concentrations ranged from 1.8 J μg/m³ to 3.2 μg/m³; and,
- cis-1,2-DCE, 1,1,1-TCA, 1,1-DCE and vinyl chloride were not detected above the reporting limit.

# 3.5 FORMER LAKA INDUSTRIES, INC. (SITE 130043K) FINDINGS

The Former LAKA Industries, Inc. site located at 62 Kinkel Street, Westbury, New York is within the central part of the NCIA. The former occupants, LAKA Tools and Stamping, and LAKA Industries used TCE as a degreaser. Soil samples collected from an abandoned drywell or cesspool contained TCE and cis-1,2- DCE. Groundwater samples collected at the same locations also contained TCE and cis-1,2-DCE. A plume of contaminated groundwater emanates from the site and has reportedly migrated approximately 700 feet down gradient from the Site. A Focused Remedial Investigation (RI) Report dated November 1998 and a Focused Feasibility Study dated May 1999 has been completed. The Proposed Remedial Action Plan for OU-1 on-site soil and groundwater was completed in September 1999; the selected remedy was the excavation and off-site disposal of soil and monitoring of the on-site groundwater for at least two years. The ROD for OU-1 was issued in February 2000 and remedial action for OU-1 began in February 2002. A soil vapor and groundwater investigation which consisted of five direct push borings drilled around the northern perimeter of the facility was conducted by CDM in 2008. Results from the investigation revealed concentrations of solvent VOCs in the soil vapor that exceeded NYSDOH guidelines. VOCs were detected in groundwater including PCE, TCE, MTBE, 1,1-DCA and cis-1,2-DCE but no VOC contaminants were detected in excess of New York State standards for Class GA groundwater. The investigation concluded that further investigation was required to evaluate potential exposures associated with vapor intrusion (CDM, 2008).

VOCs detected in sub-slab vapor and indoor air samples for the Former LAKA Industries, Inc site (Structure K) during the 2010 VI Investigation are shown in Table 3.5. Indoor air and sub-slab soil vapor locations are presented in Figure 3.5.

Chlorinated VOC results with associated NYSDOH guidance criteria that were detected in the subslab soil vapor from Structure K (K-SS-01, K-SS-02 and K-SS-03) are:

• PCE concentrations ranged from 280 μg/m³ to 1,500 μg/m³;

- carbon tetrachloride concentrations ranged from non-detect to 0.7 J μg/m³,
- cis-1,2-DCE concentrations ranged from 1.3 μg/m³ to 120 μg/m³;
- 1,1,1-TCA concentrations ranged from 36 μg/m³ to 2,100 μg/m³;
- TCE concentrations ranged from 490 J μg/m³ to 10,000 μg/m³, and
- 1,1-DCE and vinyl chloride were not detected above the reporting limit.

Chlorinated VOC results with associated NYSDOH guidance criteria that were detected in indoor air from Structure K (K-IA-01 and K-IA-02) are:

- PCE concentrations ranged from 1.7 μg/m³ to 5.4 μg/m³;
- carbon tetrachloride was detected at 0.51 J μg/m³;
- TCE concentrations ranged from  $0.6 \mu g/m^3$  to  $0.87 \mu g/m^3$ ; and
- cis-1,2-DCE, 1,1-DCE, 1,1,1-TCA and vinyl chloride were not detected above the reporting limit.

# 3.6 EZ-EM, INC. (SITE 130043N) FINDINGS

The EZ-EM, Inc. site is located at 750 Summa Ave, North Hempstead, NY in the NCIA. Advanced Food Service Equipment Manufacturing, a stainless steel kitchen equipment supplier, occupied the site between 1968 and 1971. Micro Industries, a machine shop, occupied the site between 1971 and 1982. EZ-EM has been at the site since 1982. Records indicate that Advanced Food Service stored or used 1,1,1-TCA and other solvents while at the site. A vat used for degreasing operations was located in the southwest corner of the building. A floor drain near the vat was sealed in 1978. Sample(s) collected from a dry well between 1978 and 1985 contained 1,1,1-TCA. The degreasing vat was removed in 1985. Records also show that 1,1,1-TCA and waste oil were stored in drums in the rear of the facility. It is reported that previous investigations have found high concentrations of contaminants in groundwater near the former disposal area and lower levels of contaminants from upgradient locations. Contamination at the site has been considered to be localized. A soil vapor and groundwater investigation which consisted of five direct push borings drilled at the perimeter of the facility was conducted by CDM in 2008. Results from the investigation revealed concentrations of solvent VOCs in the soil vapor that exceeded NYSDOH guidelines. VOCs were detected in groundwater including PCE, TCE, and 1,1,1-TCA with PCE and 1,1-TCA detected in excess of New York State standards for Class GA groundwater. The investigation concluded that further investigation was required to evaluate potential exposures associated with vapor intrusion (CDM, 2008).

VOCs detected in sub-slab vapor and indoor air samples for the EZ-EM, Inc site (Structure N) during the 2010 VI Investigation are shown in Table 3.6. Indoor air and sub-slab soil vapor locations are presented on Figure 3.6.

Chlorinated VOC results with associated NYSDOH guidance criteria that were detected in the subslab soil vapor from Structure N (N-SS-01, N-SS-02 and N-SS-03) are:

- PCE concentrations ranged from 1,200 μg/m³ to 15,000 μg/m³;
- 1,1-DCE concentrations ranged from non-detect to 32 μg/m³;
- cis-1,2-DCE concentrations ranged from non-detect to 2 μg/m³;
- 1,1,1-TCA concentrations ranged from 390 μg/m³ to 53,000 μg/m³;
- TCE concentrations ranged from  $80 \mu g/m^3$  to  $3{,}200 J \mu g/m^3$ , and
- carbon tetrachloride and vinyl chloride were not detected above the reporting limit.

Chlorinated VOC results with associated NYSDOH guidance criteria that were detected in indoor air from Structure N (N-IA-01 and N-IA-02) are:

- PCE concentrations ranged from 1 μg/m³ to 1.6 μg/m³;
- carbon tetrachloride concentrations ranged from 0.58 J μg/m³ to 0.7 J μg/m³;TCE concentrations ranged from non-detect to 0.33 μg/m³;
- 1,1,1-TCA concentrations were 1.2 μg/m³, and
- cis-1,2-DCE, 1,1-DCE and vinyl chloride were not detected above the reporting limit.

# 3.7 THE TISHCON CORPORATION, NEW YORK AVE (SITE 130043V) FINDINGS

The Tishcon Corporation New York Avenue site is located within the NCIA at 29 New York Avenue, North Hempstead, NY midway between Old County Road and Main Street. The Site was developed in 1952 and was used to manufacture electronic equipment until the late 1970s. Tishcon occupied the Site from 1979 to 1991 (CDM, 2008). The Tishcon Corporation manufactures dietary supplements such as vitamins. Soft gelatin capsules are also manufactured by this company. As part of the process, a 1,1,1-TCA dip was used to remove mineral oil from the capsules. Approximately four drums of 1,1,1-TCA were used per week. Soil samples collected in 1998 from an open catch basin located in the parking lot contained 1,1,1-TCA, 1,1-DCA, and methylphenol. Past operations have contaminated at least one dry well with VOCs, and the on-site contamination is believed to affect underlying

groundwater with a resulting plume that has migrated approximately 1000 feet down gradient. A RI was completed in January 2000. Based on the results, an IRM was carried out in 2000 to remove contaminated soil from the on-site dry well. The dry well was remediated in 2001. Confirmation samples showed concentrations of VOCs remaining in soils on site were below cleanup levels. A ROD was signed in 2002 recommending no further action and the site was delisted (NYSDEC, 2002). A soil vapor and groundwater investigation which consisted of five direct push borings drilled at the perimeter of the facility was conducted by CDM in 2008. Results from the investigation revealed concentrations of solvent VOCs in the soil vapor that exceeded NYSDOH guidelines. VOCs were detected in groundwater including PCE, TCE, 1,1,1-TCA, cis-1,2-DCE, 1,1-DCA and 1,1-DCE detected in excess of New York State standards for Class GA groundwater. Concentrations of VOC contaminants in excess of the groundwater standards were observed in all five of the sample locations. The investigation concluded that further investigation was required to evaluate potential exposures associated with vapor intrusion (CDM, 2008).

VOCs detected in sub-slab vapor and indoor air samples for the Tishcon Corp., New York Avenue site (Structure V) during the 2010 VI Investigation are shown in Table 3.7. Indoor air and sub-slab soil vapor locations are presented in Figure 3.7.

Chlorinated VOC results with associated NYSDOH guidance criteria that were detected in the subslab soil vapor at Structure V (V-SS-01, V-SS-02 and V-SS-03) are:

- PCE concentrations ranged from 780 J μg/m³ to 1,500 μg/m³;
- 1,1-DCE concentrations ranged from  $54 \mu g/m^3$  to  $780 J \mu g/m^3$ ;
- cis-1,2-DCE concentrations ranged from non-detect to 49 μg/m³;
- carbon tetrachloride concentrations ranged from non-detect to 0.9 J  $\mu g/m^3$ ,
- 1,1,1-TCA concentrations ranged from 290 J μg/m³ to 27,000 μg/m³;
- TCE concentrations ranged from 5.8 J  $\mu$ g/m³ to 1,000  $\mu$ g/m³, and
- vinyl chloride was not detected above the reporting limit.

Chlorinated VOC results with associated NYSDOH guidance criteria that were detected in indoor air from Structure V (V-IA-01 and V-IA-02) are:

- PCE concentrations ranged from 610 μg/m³ to 1,600 J μg/m³;
- TCE concentrations were 2.5 J µg/m³;
- carbon tetrachloride concentrations were 0.51 J μg/m³;

- 1,1,1-TCA concentrations ranged from 4.2 J  $\mu$ g/m³ to 4.7 J  $\mu$ g/m³; and
- cis-1,2-DCE, 1,1-DCE and vinyl chloride concentrations were non-detect.

Ambient air samples were collected, when possible, from the NCIA study area to demonstrate overall ambient air conditions at the time of sampling. Ambient air sample results from 2010 and 2011 are provided in Table 3.8.

Table 3.9 provides direct push soil sampling VOC results. Soil boring locations are presented on Figure 3.8. Direct push soil boring results indicate potential site contaminants (1,1,1-TCA and 1,1-DCA) detected in two of the four samples collected. Soil VOC results for the Tishcon Corp., New York Avenue site did not exceed the New York Codes, Rules and Regulations Title 6 Part 375 Soil Cleanup Objectives for unrestricted use for any of the compounds detected.

#### 4.0 CONCLUSIONS

MACTEC Engineering and Consulting, P.C. sampled seven facilities located within the NCIA as part of a VI Investigation for the NYSDEC. Based on the results of study, VOCs for which NYSDOH guidance criteria exist, were detected at the seven structures sampled. Results were compared to criteria as established in the New York State Department of Health, Center for Environmental Health, Bureau of Environmental Exposure Investigation, "FINAL Guidance for Evaluating Soil Vapor Intrusion in the State of New York" (NYSDOH, 2006). In six of the seven structures sampled during the VI Investigation, soil vapor and indoor air results for at least one compound exceeded the NYSDOH Guidance criteria for *Mitigate*, as established in "Guidance for Evaluating Soil Vapor Intrusion in the State of New York (NYSDOH, 2006). Although this guidance is based on a residential 24-hour exposure scenario, it is considered a conservative exposure estimate since exposure at each of the Sites is considerably lower given the fact the facilities in this study are of a commercial nature and individuals are not likely to be exposed for a 24 hour duration.

Results exceeding NYSDOH Guidance criteria for *Monitor and/or Mitigate* are as follows:

Structure A: IMC Magnetics (NYSDEC Site No. 130043A).

• cis-1,2-DCE, TCE and PCE exceeded NYSDOH Guidance criteria for *Mitigate*.

Structure B: Atlas Graphics (NYSDEC Site No. 130043B).

• TCE and PCE exceeded NYSDOH Guidance criteria for *Mitigate*.

Structure C: Tishcon Corp. (NYSDEC Site No. 130043C).

• PCE and 1,1,1-TCA exceeded NYSDOH Guidance criteria for *Mitigate*.

Structure F: Former Tishcon Corp. (NYSDEC Site No. 130043F).

• 1,1,1-TCA and PCE exceeded NYSDOH Guidance criteria for *Monitor*.

Structure K: Former LAKA Industries, Inc. (NYSDEC Site No. 130043K).

• 1,1,1-TCA, PCE and TCE exceeded NYSDOH Guidance criteria for *Mitigate*.

Structure N: Former EZ-EM, Inc. (NYSDEC Site No. 130043N).

• 1,1,1-TCA, PCE and TCE exceeded NYSDOH Guidance criteria for *Mitigate*.

Structure V: Tishcon Corp, New York Ave. (NYSDEC Site No. 130043V).

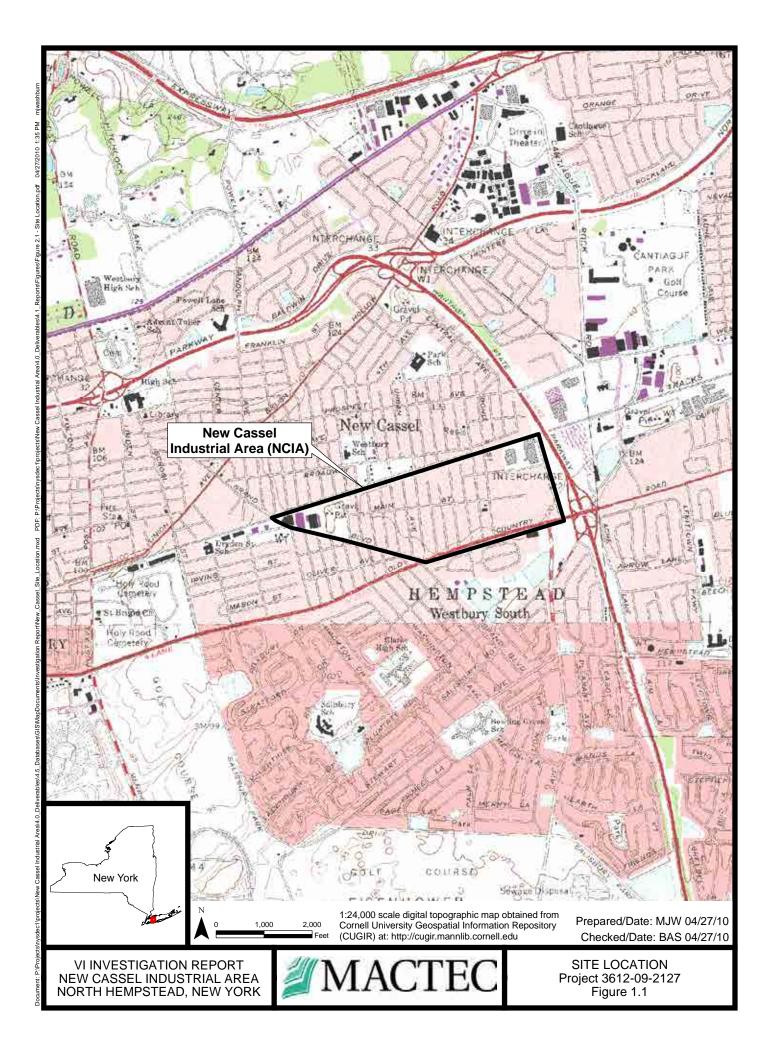

• 1,1,1-TCA, PCE and TCE exceeded NYSDOH Guidance criteria for *Mitigate*.

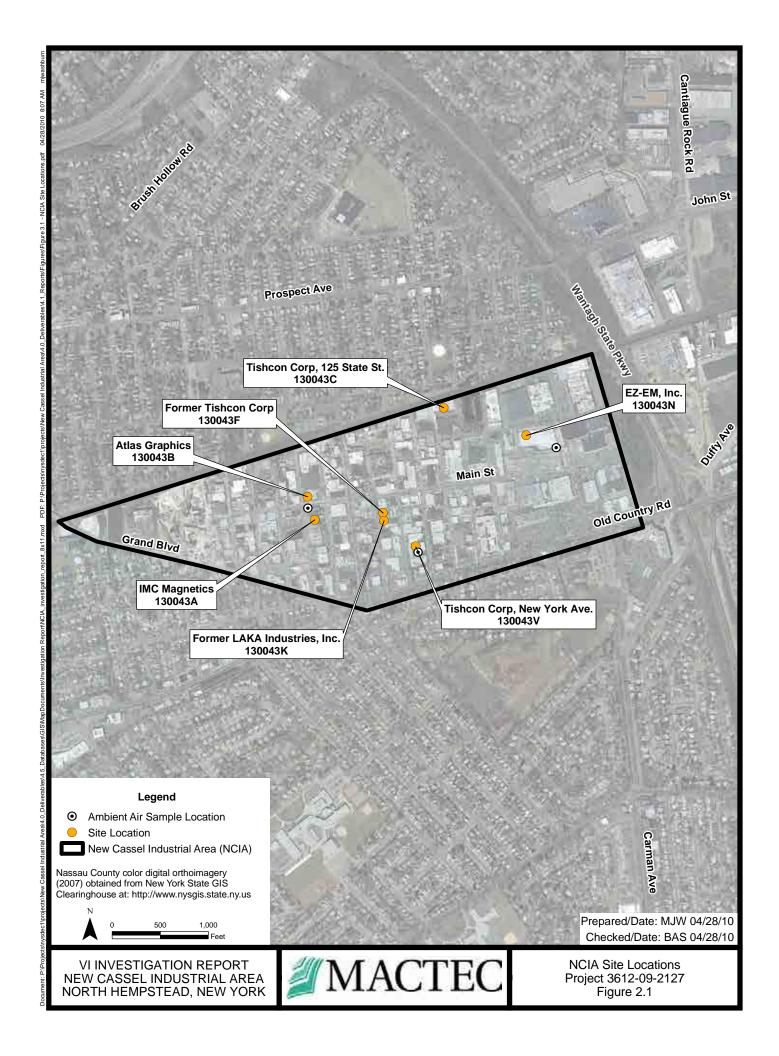

Results from this VI Investigation sampling suggest further evaluation is necessary.

NYSDEC = New York State Department of Environmental Conservation

Results in microgram per cubic meter ( $\mu g/m^3$ )

Samples analyzed for VOCs by USEPA Method TO-15.

Location Name: SV = Soil Vapor; IA = Indoor Air

OC Code:

FS = Field Sample

## Qualifiers:

- U = Not detected at a concentration greater than the reporting limit
- E = Detected at a concentration greater than the calibration range
- J = Estimated value

**Bold** = analyte detection

#### Reference:

New York State Department of Health, Center for Environmental Health, Bureau of Environmental Exposure Investigation, "FINAL Guidance for Evaluating Soil Vapor Intrusion in the State of New York", October 2006.

Highlighted results within the guidance criteria for Mitigate, as established in "Guidance for Evaluating Soil Vapor Intrusion in the State of New York (New York State Department of Health, 2006).

Highlighted results within the criteria for Monitor, as established in "Guidance for Evaluating Soil Vapor Intrusion in the State of New York (New York State Department of Health, 2006)

Highlighted results recommend that resonable and practical actions are taken to identify the source(s) and reduce exposure, as established in "Guidance for Evaluating Soil Vapor Intrusion in the State of New York"; or no further action to be taken (New York State Department of Health, 2006)

NYSDEC = New York State Department of Environmental Conservation

Results in microgram per cubic meter ( $\mu g/m^3$ )

Samples analyzed for VOCs by USEPA Method TO-15.

Location Name: AA = Ambient Air; SV = Soil Vapor; IA = Indoor Air

QC Code:

FS = Field Sample

#### Qualifiers:

- U = Not detected at a concentration greater than the reporting limit
- E = Detected at a concentration greater than the calibration range
- J = Estimated value

Bold = analyte detection

# Reference:

New York State Department of Health, Center for Environmental Health, Bureau of Environmental Exposure Investigation, "FINAL Guidance for Evaluating Soil Vapor Intrusion in the State of New York", October 2006.

#### Criteria:

Highlighted results within the guidance criteria for <u>Mitigate</u>, as established in "Guidance for Evaluating Soil Vapor Intrusion in the State of New York (New York State Department of Health, 2006).

Highlighted results within the criteria for Monitor, as established in "Guidance for Evaluating Soil Vapor Intrusion in the State of New York (New York State Department of Health, 2006).

Highlighted results recommend that resonable and practical actions are taken to identify the source(s) and reduce exposure, as established in "Guidance for Evaluating Soil Vapor Intrusion in the State of New York"; or no further action to be taken (New York State Department of Health, 2006)

NYSDEC = New York State Department of Environmental Conservation

Results presented in microgram per cubic meter  $(\mu g/M^3)$ 

Samples analyzed for VOCs by USEPA Method TO-15.

 $VOC = volatile \ organic \ compound$ 

 $Location\ Name:\ AA = Ambient\ Air;\ SV = Soil\ Vapor;\ IA = Indoor\ Air$ 

QC Code:

 $FS = Field \ Sample$ 

Qualifiers:

 $\boldsymbol{U} = \boldsymbol{Not}$  detected at a concentration greater than the reporting limit

J = Estimated value

 $\boldsymbol{Bold} = analyte \; detection$ 

Reference:

New York State Department of Health, Center for Environmental Health, Bureau of Environmental Exposure Investigation, "FINAL Guidance for Evaluating Soil Vapor Intrusion in the State of New York", October 2006.

# Criteria:

Highlighted results within the guidance criteria for <u>Mitigate</u>, as established in "Guidance for Evaluating Soil Vapor Intrusion in the State of New York (New York State Department of Health, 2006).

Highlighted results within the criteria for **Monitor**, as established in "Guidance for Evaluating Soil Vapor Intrusion in the State of New York (New York State Department of Health, 2006).

Highlighted results recommend that resonable and practical actions are taken to identify the source(s) and reduce exposure, as established in "Guidance for Evaluating Soil Vapor Intrusion in the State of New York"; or no further action to be taken (New York State Department of Health, 2006)

NYSDEC = New York State Department of Environmental Conservation

Results in microgram per cubic meter ( $\mu g/m^3$ )

Samples analyzed for VOCs by USEPA Method TO-15.

Location Name: AA = Ambient Air; SV = Soil Vapor; IA = Indoor Air

QC Code:

FS = Field Sample

#### Qualifiers:

- $\boldsymbol{U} = \boldsymbol{Not}$  detected at a concentration greater than the reporting limit
- $E = Detected \ at \ a \ concentration \ greater \ than \ the \ calibration \ range$
- J = Estimated value

**Bold** = analyte detection

#### Reference:

New York State Department of Health, Center for Environmental Health, Bureau of Environmental Exposure Investigation, "FINAL Guidance for Evaluating Soil Vapor Intrusion in the State of New York", October 2006.

#### Criteria

Highlighted results within the criteria for Monitor, as established in "Guidance for Evaluating Soil Vapor Intrusion in the State of New York (New York State Department of Health, 2006).

Highlighted results recommend that resonable and practical actions are taken to identify the source(s) and reduce exposure, as established in "Guidance for Evaluating Soil Vapor Intrusion in the State of New York"; or no further action to be taken (New York State Department of Health, 2006)

NYSDEC = New York State Department of Environmental Conservation

Results in microgram per cubic meter (µg/m³)

Samples analyzed for VOCs by USEPA Method TO-15.

Location Name: AA = Ambient Air; SV = Soil Vapor; IA = Indoor Air QC Code:

FS = Field Sample

# Qualifiers:

U = Not detected at a concentration greater than the reporting limit

 $E = Detected \ at \ a \ concentration \ greater \ than \ the \ calibration \ range$ 

J = Estimated value

Bold = analyte detection

#### Reference:

New York State Department of Health, Center for Environmental Health, Bureau of Environmental Exposure Investigation, "FINAL Guidance for Evaluating Soil Vapor Intrusion in the State of New York", October 2006.

#### Criteria:

Highlighted results within the guidance criteria for <u>Mitigate</u>, as established in "Guidance for Evaluating Soil Vapor Intrusion in the State of New York (New York State Department of Health, 2006).

Highlighted results within the criteria for Monitor, as established in "Guidance for Evaluating Soil Vapor Intrusion in the State of New York (New York State Department of Health, 2006).

Highlighted results recommend that resonable and practical actions are taken to identify the source(s) and reduce exposure, as established in "Guidance for Evaluating Soil Vapor Intrusion in the State of New York"; or no further action to be taken (New York State Department of Health, 2006)

NYSDEC = New York State Department of Environmental Conservation

Results in microgram per cubic meter (µg/m³)

Samples analyzed for VOCs by USEPA Method TO-15.

Location Name: AA = Ambient Air; SV = Soil Vapor; IA = Indoor Air

QC Code:

FS = Field Sample

Qualifiers:

U = Not detected at a concentration greater than the reporting limit

J = Estimated value

**Bold** = analyte detection

New York State Department of Health, Center for Environmental Health, Bureau of Environmental Exposure Investigation, "FINAL Guidance for Evaluating Soil Vapor Intrusion in the State of New York", October 2006.

### Criteria:

Highlighted results within the guidance criteria for Mitigate, as established in "Guidance for Evaluating Soil Vapor Intrusion in the State of New York (New York State Department of Health, 2006).

Highlighted results recommend that resonable and practical actions are taken to identify the source(s) and reduce exposure, as established in "Guidance for Evaluating Soil Vapor Intrusion in the State of New York"; or no further action to be taken (New York State Department of Health, 2006)

NYSDEC = New York State Department of Environmental Conservation

Results in microgram per cubic meter (µg/m³)

Samples analyzed for VOCs by USEPA Method TO-15.

Location Name: AA = Ambient Air; SV = Soil Vapor; IA = Indoor Air

QC Code:

FS = Field Sample

FD = Field Duplicate Sample

#### Qualifiers:

- U = Not detected at a concentration greater than the reporting limit
- $E = \mbox{Detected at a concentration greater than the calibration range} \label{eq:energy}$
- J = Estimated value

**Bold** = analyte detection

## Reference:

New York State Department of Health, Center for Environmental Health, Bureau of Environmental Exposure Investigation, "FINAL Guidance for Evaluating Soil Vapor Intrusion in the State of New York", October 2006.

#### Criteria:

Highlighted results within the guidance criteria for <u>Mitigate</u>, as established in "Guidance for Evaluating Soil Vapor Intrusion in the State of New York (New York State Department of Health, 2006).

Highlighted results within the criteria for <u>Monitor</u>, as established in "Guidance for Evaluating Soil Vapor Intrusion in the State of New York (New York State Department of Health, 2006).

Highlighted results recommend that resonable and practical actions are taken to identify the source(s) and reduce exposure, as established in "Guidance for Evaluating Soil Vapor Intrusion in the State of New York"; or no further action to be taken (New York State Department of Health, 2006)

#### **Notes:**

VOC = volatile organic compounds (only detected compounds shown.)

Samples analyzed for VOCs by EPA Method 8260B

mg/kg = milligrams per kilogram

ft bgs = feet below ground surface

Qualifiers:

U = Not detected greater than the reporting limit

J = Estimated value

Criteria = 6 NYCRR 375 Soil Cleanup Objectives for unrestricted use.

Detections are indicated in **BOLD**
